

Why thirty-one cultures read as one city

Seven dead-on elevations, same tripod, same scale, ground hidden. The red rules are not drawn per building — they are the **shell's** constants, ruled at the same heights across all seven. Every culture's floors land on them, because the shell is built before the facade runs and the facade is only allowed to decorate it.

THE SHELL

What all six of the others actually are. Everything past this point is applied to this.

Grand Mosque

Ottoman / Mughal

Tiered Eaves

East Asian

Pueblo Adobe

Puebloan / Saharan

Gothic Revival

Northern European medieval

Chicago Loft

American industrial

Second Empire

French 19th century

WHAT IS SHARED, IN THE SOURCE

FH = 3.2 m — floor-to-floor, a module constant in `buildings.js:100`. Not a per-building value, not something a facade can set. A machiya has 2.4 m floors, a temple has bays instead of storeys, and a prayer hall has neither.

sill 0.55 · header 0.45 · bay 1.5 m — `buildings.js:4164`. The same glazing band on every storey of all four faces (the pink band above). The only thing that varies is `modern = storeys >= 3` — it varies on *height*, not on what the building is.

One rectangular prism, $w \times d$. There is no courtyard, no compound, no wall, no gate — and a villa, a riad and a siheyuan are all the *void in the middle*, not the wall around it.

One palette per district. Culture reads as colour at 100 m before it reads as ornament at 10 m.
